

Stack →

```
#include <iostream>
```

```
#include <stack>
```

```
stack<int> st; // Initializing a stack
```

stack method

st.push(10); pushes an element in the stack

st.pop(); pops the top element of the stack

st.top(); access the top element;

st.empty(); checks if the stack is empty

st.size(); Get the stack size.

Stack Implementation →

```
#include <bits/stdc++.h>
```

```
using namespace std;
```

```
class stack{
```

```
public:
```

```
vector<int> stack_;
```

```
stack(){};
```

```
void push(int n){
```

```
    stack_.push_back(n);
```

```
}
```

```
int pop(){
```

```
    int res = stack_[stack_.size-1];
```

```
stack_.pop-back();  
return res;
```

```
}
```

→ practice (8th, April, 2025)

```
#include <bits/stdc++.h>
```

```
using namespace std;
```

```
#include <bits/stdc++.h>
```

```
using namespace std;
```

```
class stack {
```

```
public:
```

```
vector<int> stack_;
```

```
stack()
```

```
{
```

```
}
```

```
void push(int n){
```

```
    stack_.push_back(n);
```

```
}
```

```
int pop(){
```

```
    int res = stack_[stack_.size()-1];
```

```
    stack_.pop_back();
```

```
    return res;
```

```
}
```

practice sheet 12/4/2025

```
#include <bits/stdc++.h>
```

```
using namespace std;
